

Project Title

AI Email Triage & Auto-Responder Agent Using n8n

Problem Statement

Organizations receive a large number of emails every day, making it difficult to manually read, classify, prioritize, and respond to each message efficiently. This often leads to delayed responses, increased workload, and poor customer satisfaction. An intelligent system is needed to automate email management by understanding email content, generating appropriate responses, and routing important emails to the correct department.

Objective

To develop an AI-powered Email Triage and Auto-Responder Agent using n8n that automatically analyzes incoming emails, identifies their intent, generates context-aware responses, and forwards critical emails to the appropriate team.

Features

- Automatic email monitoring
- Email intent classification using AI
- Smart response generation
- Priority detection
- Email routing to relevant departments
- Logging and tracking of email activities
- Real-time notifications

Technologies Used

- n8n
- OpenAI GPT
- Gmail API

- Google Sheets
- Slack
- Notion (Optional)

Workflow

1. New email arrives in Gmail.
2. n8n triggers the workflow.
3. AI analyzes the email content.
4. Email is classified (Support, Complaint, Inquiry, Feedback, etc.).
5. AI generates a suitable response.
6. Response is sent automatically.
7. Important emails are forwarded to the concerned team.
8. Email details are stored in Google Sheets for monitoring and analytics.

Expected Outcome

- Reduced manual email handling
- Faster response times
- Improved customer experience
- Efficient email prioritization
- Increased productivity through automation

Future Enhancements

- Multi-language support
- Sentiment analysis
- Voice-to-email processing
- CRM integration

- Advanced analytics dashboard

This problem statement is ideal for an n8n Agentic AI project because it combines **AI decision-making, automation, workflow orchestration, and real-world business applications.**
